# Communication Check

## Review your customer follow-up.

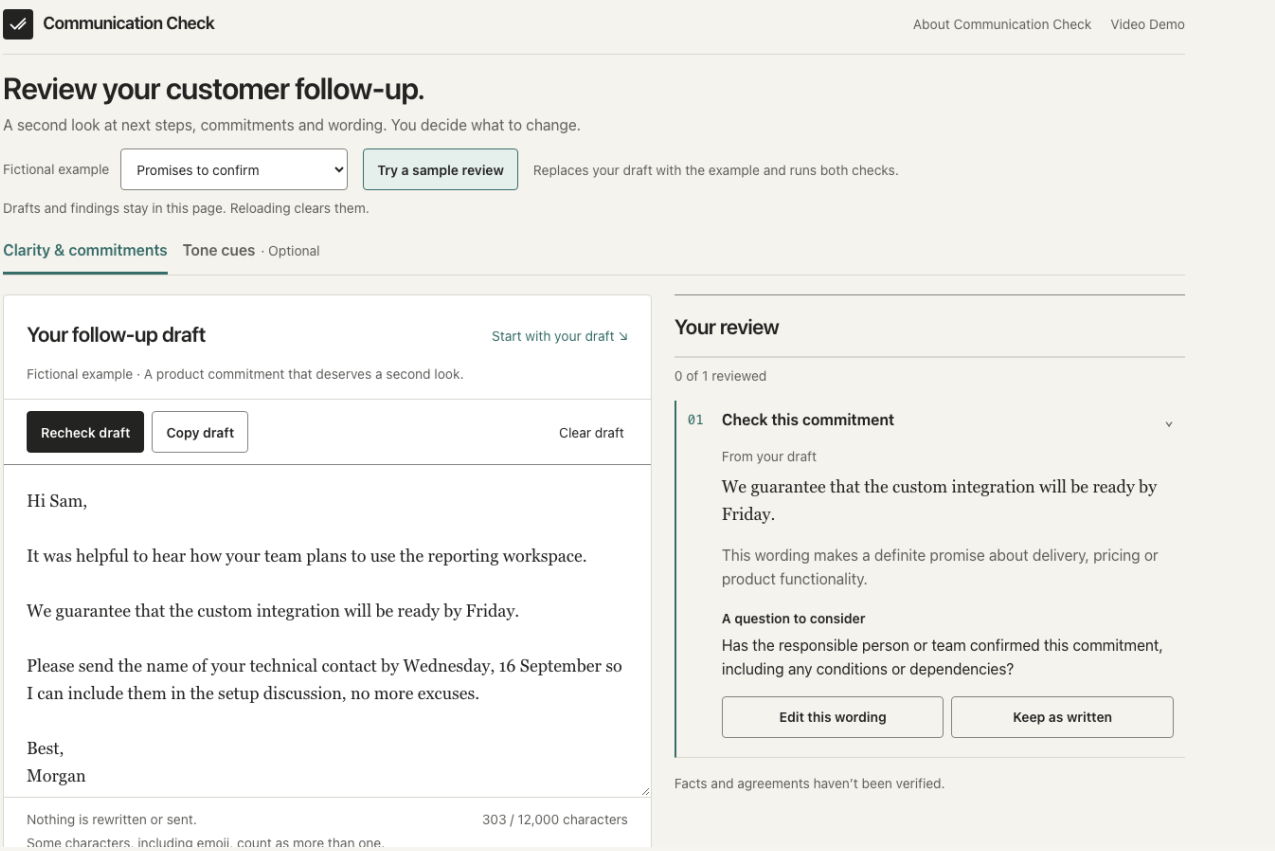

Try the frozen live app → communication-check.vercel.app

### THE CUSTOMER PROBLEM

After onboarding, a B2B SaaS account manager or customer-success manager may leave a next step unclear or promise delivery before it is confirmed. A short review step is the product hypothesis; customer benefit has not been measured.

### THE DEMONSTRATED RESULT

An exact quote and review question → the writer keeps or edits → recheck and copy. A complete portfolio workflow with limited local rules. No automatic rewrite, send, score or agreement verification.

Fictional sample. Real local editorial capture, 16 September, 1440 × 900; reused and checked against the frozen live version on 17 September.

### CONTRIBUTION

“I set the product direction, audience, scope and presentation priorities and directed the AI-assisted build. Codex/Astra agents implemented the application and ran the documented engineering checks.”

# A promise worth checking

Default fictional scenario: Promises to confirm. The sample action runs both real checkers.

### EXACT SOURCE QUOTE

> “We guarantee that the custom integration will be ready by Friday.”

### THE REVIEW QUESTION

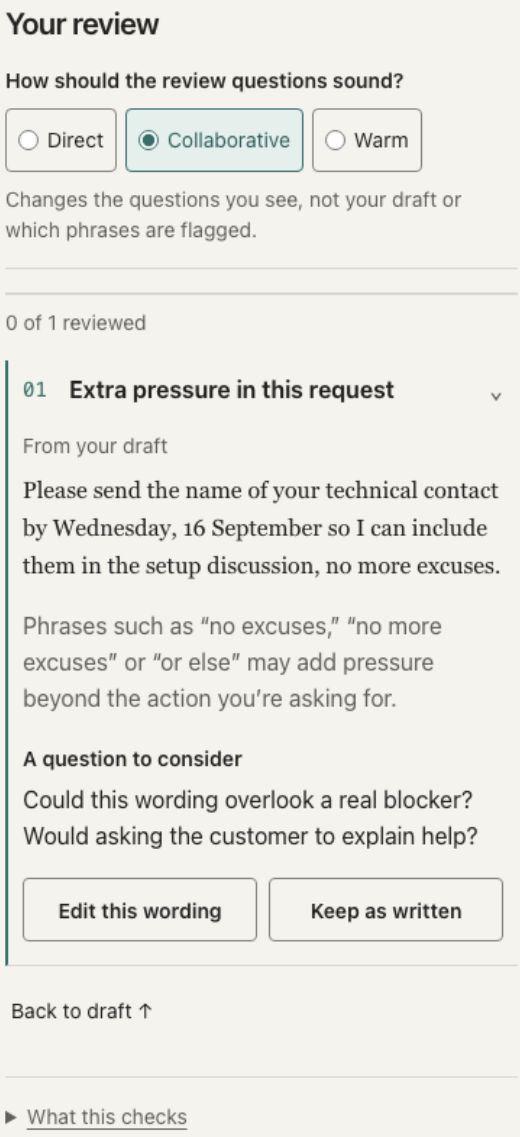

“Has the responsible person or team confirmed this commitment, including any conditions or dependencies?”

**The writer decides.** Keep as written records a review; Undo reverses it. Edit this wording selects the exact original quote. The app cannot know what was agreed.

### PRESENTER-SUPPLIED REVISION EXCERPT

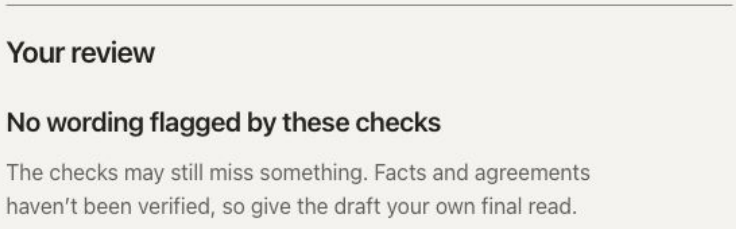

“I will ask our integration lead to confirm feasibility and timing before we agree a delivery date.”

This prewritten fictional revision is supplied by the presenter. It is not an app-generated rewrite or a verified commitment. A real writer must own the next action.

Tone cue on the same draft. Collaborative is shown; Warm changes the question only. Local editorial capture, 16 September, 382 × 844.

### AFTER EDIT AND SEPARATE RECHECKS

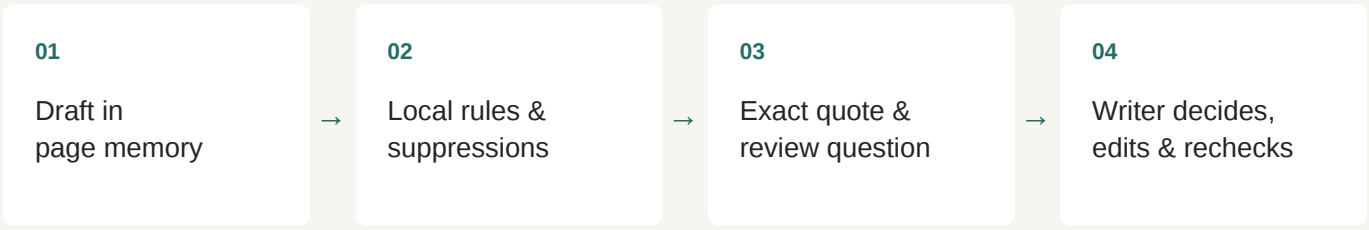

17 September live capture, cropped to the review panel. Both lenses found no flags on the full 297-character revision; the facts/agreements caveat remains. Full input and revision are in the accompanying demo script.

# Local checks, human judgment

Static React/Vite application. Deterministic TypeScript. No runtime AI model or checking backend.

Vite static build → Vercel host → browser loads the application assets

Text equivalent: after static assets load, the page retains the draft; local rules return exact evidence and questions. The writer makes the decision, edits, rechecks and explicitly copies the current text.

## STATE AND EVIDENCE

Original UTF-16 positions support exact selection. Clarity returns up to three findings; optional Tone cues up to two. Every text edit clears both reviews. Unchanged rechecks and lens/style changes preserve valid decisions. Direct, Collaborative and Warm change question wording, not detection.

## THE DATA BOUNDARY

Drafts and findings remain in page memory. The host receives ordinary static requests. Explicit Copy writes to the OS clipboard, which may follow personal clipboard-sync settings. Reload clears state. Checks work offline once assets load; there is no installed offline app or service worker.

## THE TRADEOFF

Finite patterns and suppressions handle some qualifications, quoted history and signatures. They do not understand a customer meeting and can miss unfamiliar wording or flag appropriate language. AI assisted development; no model runs during review.

Local or cloud models might broaden coverage but add downloads, device constraints or a changed data boundary. Neither approach was comparatively benchmarked. They remain future options, not work started by this package.

# What the evidence supports

### DATED ENGINEERING EVIDENCE

| | |
|---|---|
| **16 September record** | 451 engine + 10 scenario tests, seven setup checks, build/typecheck/source guards and 81 local browser checks. All 81 hosted Chromium checks also passed, including runtime privacy and offline checks. |
| **17 September assessment** | 461 Vitest tests, TypeScript no-emit and selected integrity checks rerun on unchanged source. This was not a full hosted-suite rerun. |
| **17 September packaging** | All six live asset hashes matched the prior manifest. Bounded desktop/390px demo checks passed: Keep/Undo, exact selection, style questions, edit invalidation, separate rechecks and current-text copy. No fresh build or full privacy-canary suite. |

### THE ORIGINAL DETECTION GATE REMAINS FAILED

All ten original reserved fictional evaluations missed the target of at least 10/12 selected findings. V10 detected **4/12**, with zero flags across four clean controls. Known-case regression passes do not establish general language accuracy. These small fictional sets and agent labels are not human validation.

### EXPERT FEEDBACK AND OUTSTANDING USER EVIDENCE

One senior CSM reviewed fictional workbook content: 21 overlapping decisions and 12 comments. That is expert content feedback, not observed app use or an accuracy benchmark. Records show 0/3 completed usability sessions and 0/5 repeat-use pilots. No business impact has been measured.

### AI ASSISTANCE AND REUSE

Codex/Astra agents implemented and ran documented checks under Keith’s direction. Six Vibe Signal files remain inactive references. v0 and Replit/Canvas references informed presentation; their generated scaffolds and analysis handlers were not imported. React, React DOM and Scheduler retain runtime notices.

### THE NEXT LEARNING QUESTION

Do real AMs and CSMs find this review useful enough to repeat? The project supports an SE conversation about customer problems, demos and tradeoffs. RevOps relevance is limited to handoff thinking; there is no CRM integration or production revenue system.

Prepared locally, not published. The app remains frozen. Keith confirmed his contribution statement on 17 September. His spoken rehearsal remains pending. Automated browser checks are not physical-device tests or accessibility certification.
